Abstract—The purpose of this study was to determine if there were differences in the prevalence of musculoskeletal disorders among different types of workers. The subjects included all employees of a large manufacturing company who had been employed at least one year. A questionnaire was sent to each employee asking about symptoms of musculoskeletal disorders and work-related factors. The results showed that the prevalence of musculoskeletal disorders was higher among non-manual workers than manual workers. The prevalence of musculoskeletal disorders was also higher among workers who reported working longer hours, working in noisy environments, and working in environments with poor lighting. The results suggest that there are differences in the prevalence of musculoskeletal disorders among different types of workers, and that these differences may be related to work-related factors.
